Outline

- The aims and challenges of RPW detection
- Main advances in RPW detection
 - Pros and Cons
 - Future directions

Aims and Constrains

Prevention

Introduction

At trade points

Spread

Palms are accessible for direct inspection

Damages

Monitoring

Infestation/damage levels in time & space

Treatment effectivity

In large open areas

Limited accessibility

Detection is half of the solution to RPW problem!

**But is it possible to do it:
Precisely
Fast
Non-destructively
and
at affordable costs?**

SIGHT

Inspection of the palms for symptoms of damages and weevil presence:

- in the crown
- in the stipe
- among the offshoots
- around the palm base

Detection of visual symptoms of initial infestation stages

Mostly Canary palms	Holes in one or more leaves in canary palms	
	Extensive chewing symptoms of ">" shape	
	No new inner leaves	
Mostly date palms	Oozing holes in the stipe in date palm	
	Dry offshoot/s in date palms	

Shortcomings of direct visual detection

**Detection of early infestation stages is impossible
especially in date palms**

Sensitivity and specificity are low

Unreliable, unless combined with other means!!!

VISUAL/THERMAL IMAGING DETECTION

Direct effects of the weevil activity

RPW larvae create tissue fermentation raising trunk temperature up to 45°C

Indirect effects of the weevil activity

RPW larvae chew the fronds' bases or palm stem, reduce water availability in the fronds (water stress)

Decrease in stomatal conductance

Increase in leaf temperature

Thermal detection of infested Canary palms in quarantine

Temperature

Stomatal conductance

41 days PI

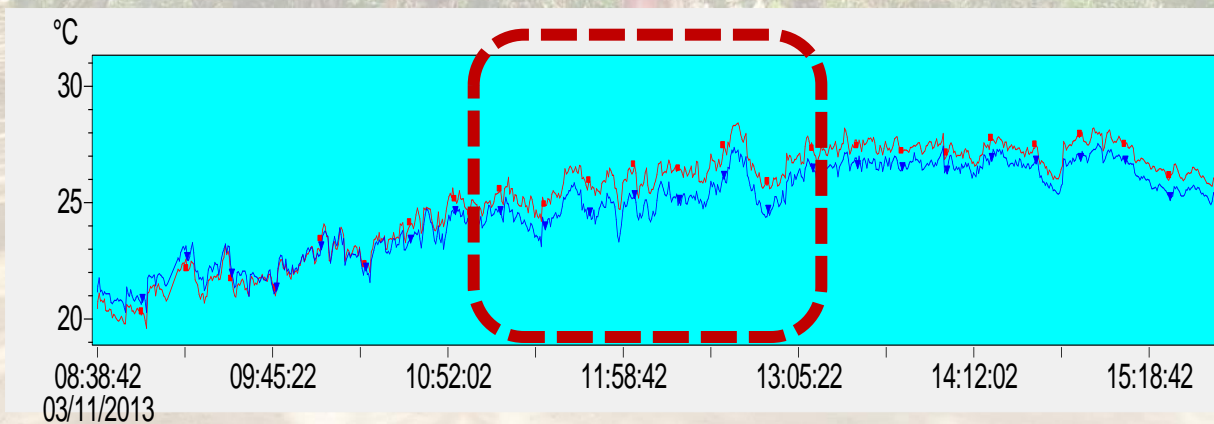

Thermal detection in plantation

Monitoring dispersion

Data collection

- 1059 Traps
- Monitoring 1-2 times per month
- (22 month, 01/2012 and 11/2013)

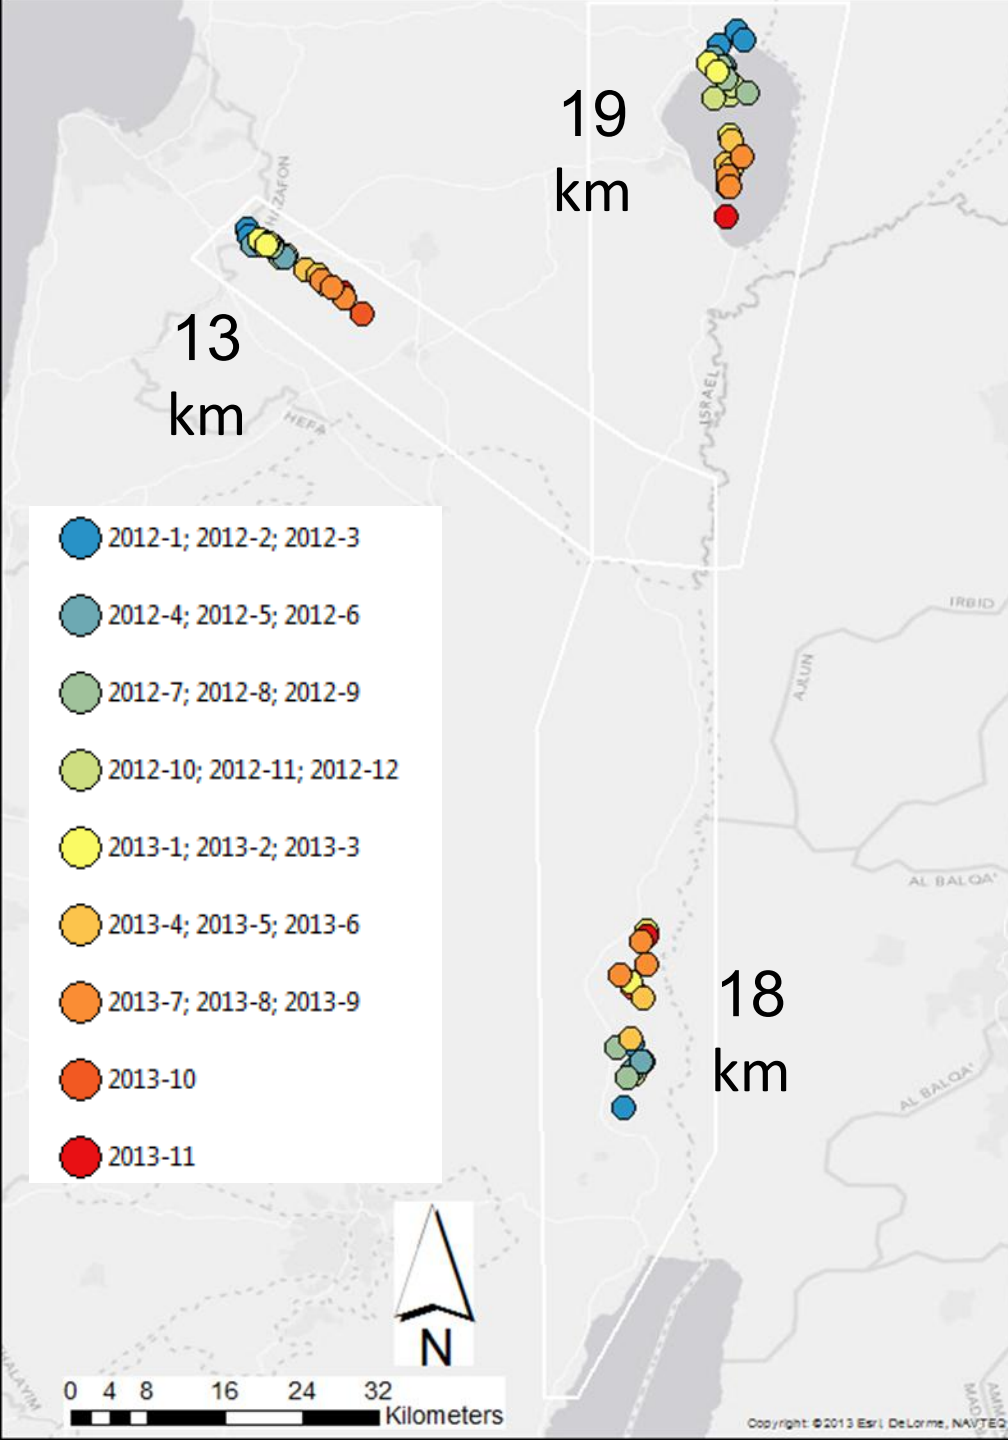

Data analysis

- % of catching traps
- number of RPW trapped per trap
- geographical center

Mapping temporal changes in geographical center of catching traps

blue & green – 2012's
yellow & red – 2013's

Monitoring in organic orchard

How many traps to set?

- The potential area covered by each trap is still unknown.
- Geostatistical analysis of trapping distribution and abundance suggested for monitoring:
 - In date palm plantation: 1 trap per 0.35 ha (60X60m)
 - In urban areas: 1 trap per 0.5 ha

Chemical detection

Rational:

Weevil infested palms emit characteristic volatile cues

The sources of the volatile cues

Palm tissue

wound or weevil
induced

weevils

weevil's frass

Sniffer dogs

Electronic nose

Electronic tongue

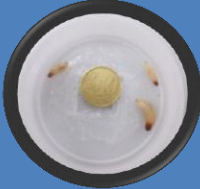

Sniffer dogs at work

The ability Labrador Retriever to discriminate between Canary palms infested with one young RPW larva and uninfested palms

 Response categories	Time interval after infestation (hours)			
	2 h	24 h	48 h	120 h
TP	90%	77%	90%	87%
FN	10%	23%	10%	13%
FP	2%	1%	1%	0%
TN	98%	99%	99%	100%

True positive (TP); False negative (FN); False positive (FP); True negative (TN)

Dog detection precision in different the palm species

Phoenix canariensis and *Trachycarpus fortunei*

Detection is specific

On leash

Free search

Potted palm trees / Plastic pots

Scents- station tested

Rice weevil *Sitophilus oryzae*

Indian meal moth *Plodia interpunctella*

Rusty grain beetle *Cryptolestes ferrugineus*

response categories	accuracy (%)
TP	100%
FN	0%
FP	10%
TN	90%

A few open questions:

- What are the specific chemical cues emitted by RPW infested palms?
- What are the cues the trained dogs use to identify the infested palm?

- From what distance the infestation can be chemically detected ?

Acoustic detection

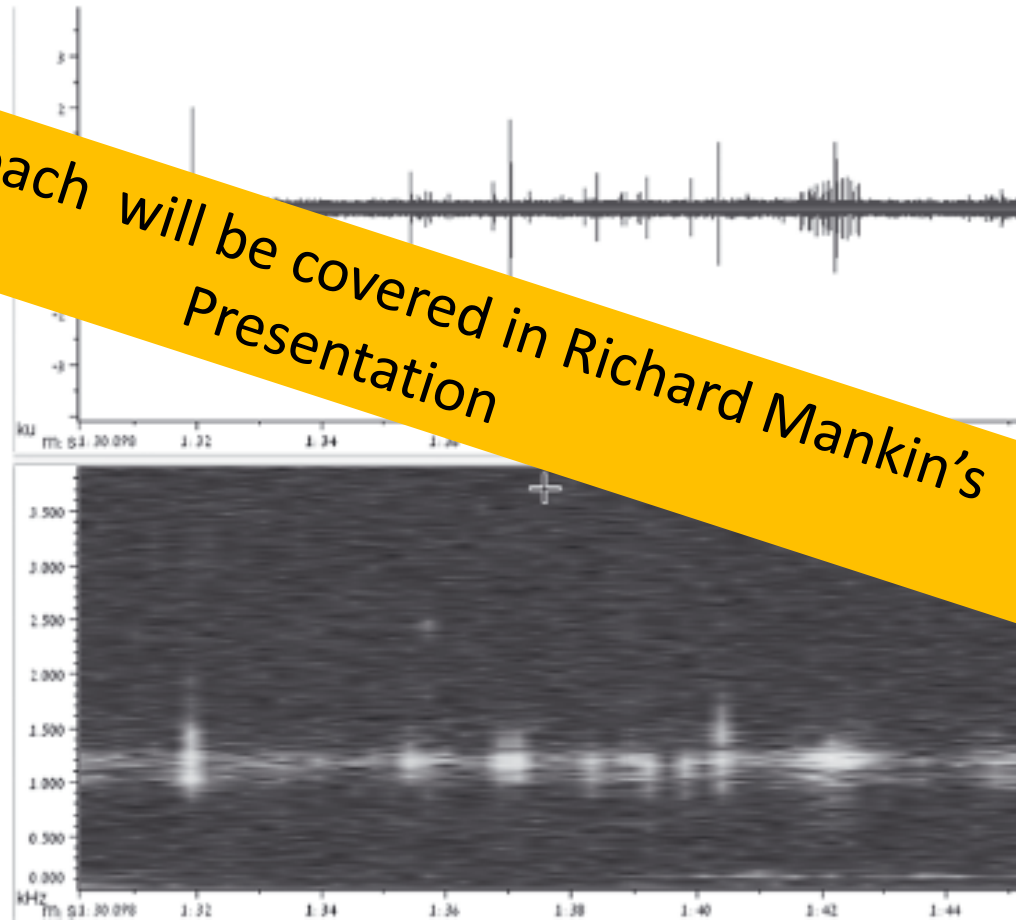

This approach will be covered in Richard Mankin's Presentation

a. Y

- move
- secreting
- spinning

b. Palm-derived:

- Air bubbles
- Water movement
- Fiber friction
- Tear of fibers

Typical acoustic signal acquired from RPW-infested palm tree. Top: signal energy (kU – signal intensity); bottom: signal frequency (kHz); horizontal axis: time (s)

Pos and Cons of main detection techniques

Parameter	Acoustic	Olfactory-trained dogs	Thermal remote sensing & GIS	Monitoring traps
Individual examination	Required 🙅	Required 🙅	Not necessary 👍	Required 🙅
Special equipment	Yes 	Trained dog 	Yes (not yet operational)	 and lures
Labor	Low if automated	Medium	Low if automated	Medium
Trained labor	No 👍	Yes 🙅	Yes 🙅	Not much 👍
Sensitivity	80–95% under controlled environment 👍	64–75% 👍 Depends on breed and training	Still unknown 🙅	High 👍
Cost	Affordable 👍	Affordable 👍	Not yet 🙅	Affordable 👍
Suitability	Quarantine Open areas	Mostly for local detection	Open areas	Quarantine and open areas 👍

More considerations:

Means	Preferable techniques for detection of :			
	Infestation risk assessment (early detection) Area wide	Active infestation Area wide	RPW damaged palm	palm with active RPW infestation
Traps	+	+	+?	+?
Manual visual inspection	+?	+	+	--
Thermal	+?	+	+	-
Dogs	-	+?	+	+?
Acoustic	-	+?	+	+

Summary & Conclusions about detection tools

Quarantine detection

Acoustics and trained dogs currently appear to be the preferred means for early detection of RPW in quarantine and are also applicable to other quarantine borers

But traps are also vital for general assessment of infestation risk at quarantine area!

Area wide detection

1. Baited traps are still an essential monitoring tool
2. Regular visual monitoring is essential
3. Systematic GIS linked data collection is indispensable

<http://gis.agri.gov.il/mobile>

4. Thermal imaging detection of palm damage symptoms is feasible, yet the methodology is still at initial stages of development.

Pontikakos et al, 2017

Future challenges

- Automatic detection by **reliable & affordable** electronic equipment.
- Aerial and satellite area wide detection.
- GIS and Cloud technologies operating info from a number of sensors for risk assessment at real time.

A photograph of a tropical garden or park. In the foreground, a wide, light-colored dirt path leads from the bottom left towards the center. To the left of the path, there is a low, rectangular concrete structure. The garden is filled with numerous palm trees of varying heights and sizes. Their fronds are green and some are drooping. The ground is covered with patches of green grass and dry, brownish leaves. In the background, more trees and a clear sky are visible. The overall scene is bright and sunny.

**Thank you for the
attention!!!**
